

The Simple, Secure & Compliant User Access Platform

Xona safeguards against cyber risks, including insider threats, through its unique, browser-based hardened platform. Xona utilizes protocol and system isolation, encrypted display, multi-factor authentication as well as session logging and recording of user access to any industrial application.

In addition, Xona improves operational efficiencies through comprehensive user access visibility and control.

XONA IS THE WORLD'S FIRST ZERO-TRUST USER ACCESS PLATFORM FOR CRITICAL INFRASTRUCTURE

COMPLIANT

Xona meets stringent compliance standards including NERC CIP, ISA 99/62443, HIPAA and NIST 800-53 in regulated industries including energy, finance, healthcare and government.

MULTI-FACTOR AUTHENTICATION

Xona provides secure token-based, multifactor authentication, meeting policy and compliance requirements.

CLIENTLESS AND BROWSER BASED

Xona provides employees, vendors and other contractors secure, clientless, browser-based access. Xona does not require any agents or clients on the endpoint to deploy and maintain, enabling simple and secure access for third parties.

ACCESS PROTECTION

Xona employs encrypted browser-based thin client access to its clientless secure gateway using mutual transport layer security (TLS). The Xona gateway ensures that data held on critical infrastructure systems does not migrate to the endpoint. Xona only remotes the pixels of the data, radically reducing the attack surface to OT systems.

ACCESS MANAGEMENT

Xona provides options for granular zero-trust-based user access by user role, time and specific system or application connection. Xona provides access management through its Remote Operations Access Manager (ROAM), which provides administrative and operational policy control over the Xona gateways.

Xona provides simple and secure access to critical assets.

LOGGING AND RECORDING

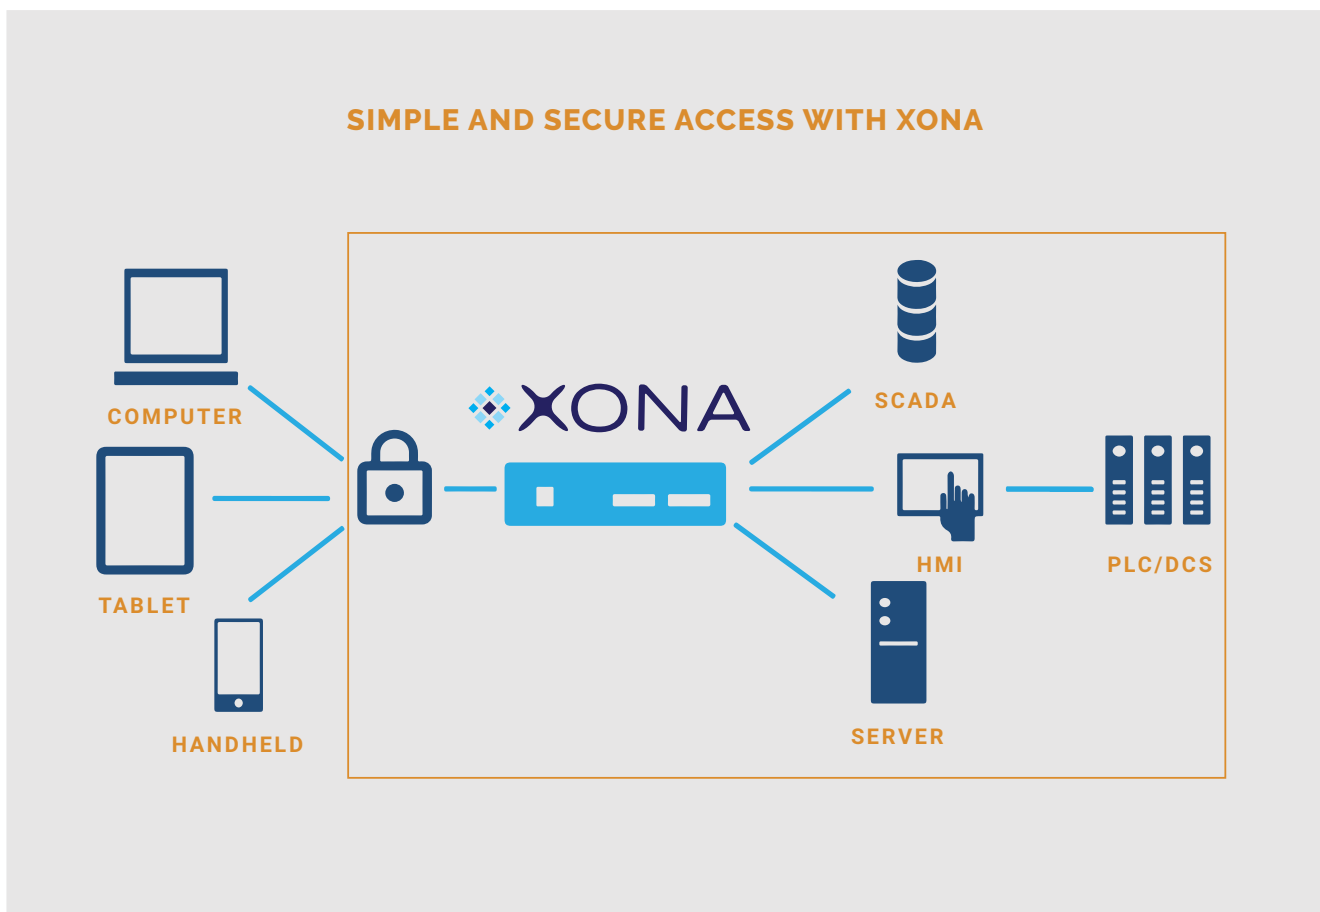

Xona's platform provides detailed user access and event logs and user session screen recording. These recordings allow for a firsthand look into the exact actions of any user and could be used for insider threat detection as well as on-the-job training. All logging and recordings can be integrated with your Security Information Event Manager (SIEM).

SIMPLE END-USER INSTALL

The Xona platform can be deployed in minutes, enabling access to sensitive applications on any system resource while eliminating client-side software support.

COST EFFECTIVE

Xona is cost effective thanks to our simple, flexible deployment and architecture. Xona removes the need for multiple integrated point access technologies.

Xona provides simple and secure access to critical assets.
